1.0 PURPOSE

The purpose of this SOP is to define suction lysimeter soil moisture sampling procedures that will ensure collection of a representative soil moisture sample from the vadose zone.

2.0 APPLICABILITY

This procedure applies to the collection of soil moisture samples for analysis. Soil moisture samples are generally used as an aid in tracking the migration of contaminated inorganic constituents through the vadose zone to the water table. The only chemical constituent for which suction lysimeters are currently being sampled is tritium at Site 300. Because of the use of pressurized air for sample retrieval, the use of suction lysimeters is not appropriate for the collection of volatile organic compound (VOC) samples.

4.0 DEFINITIONS

See SOP Glossary.

5.0 RESPONSIBILITIES

5.1 Division Leader

The Division Leader's responsibility is to ensure that all activities performed by ERD at the Livermore Site and Site 300 are performed safely and comply with all pertinent regulations and procedures, and provide the necessary equipment and resources to accomplish the tasks described in this procedure.

Procedure No. ERD SOP-1.9	Revision Number 4	Page 3 of 11
------------------------------	----------------------	--------------

5.2 Field Personnel

The Field Personnel are responsible for properly performing lysimeter sampling in compliance with all applicable regulations and procedures to ensure that the samples and resulting data are representative of the actual conditions.

5.3 Sampling Coordinator (SC)

The SC is responsible for generating all applicable field sheets.

5.4 Subproject Leader (SL)

The SL is responsible for updating the list of lysimeter locations to be sampled and providing it to the SC. The SL is also responsible for ordering repair of inoperable lysimeters. Additionally, the SL is responsible for assuring that the resulting tritium activity data is reviewed for historical consistency.

6.0 PROCEDURES

6.1 Preparation

- 6.1.1 Perform preparation activities per SOP 4.1, "General Instructions for Field Personnel."
- 6.1.2 Check the following equipment for proper operation:
 - A. Air/vacuum pumps.
 - B. Vacuum and pressure gauges.
 - C. Gasoline-driven generator to be used with the vacuum pump. Wear gloves at all times when handling a generator, and dispose of gloves immediately after use.
- 6.1.3 Obtain equipment and supplies as listed in Attachment A, and load into the field sampling vehicle.
- 6.1.4 Locate lysimeters to be sampled, and choose the most efficient sampling order. Sample from lowest contaminated area to most contaminated area.
- 6.1.5 Fill out initial information in Document Control Logbook per instructions in SOP 4.2, "Sample Control and Documentation."

6.2 Lysimeter Sampling Procedure

- 6.2.1 Unlock the steel protective casing, and remove any dirt or debris from the gas-line fitting with a clean disposable towel.
- 6.2.2 Inspect the dedicated sample line for damage, and replace if necessary.
- 6.2.3 Attach a vacuum gauge (measuring centibars of soil suction) to the male quick-disconnect fitting attached to the lysimeter sanitary seal (Attachment B).
- 6.2.4 Connect the lysimeter's dedicated sample line to the vacuum port on the pump.
- 6.2.5 Plug the vacuum pump into the generator, and pull-start the generator (with the breaker switch off).

Procedure No. ERD SOP-1.9	Revision Number 4	Page 4 of 11
------------------------------	----------------------	--------------

- 6.2.6 Open the air-intake valve on the pump, and turn the generator breaker switch on.
- 6.2.7 Slowly open the valve on the vacuum port in order to create a vacuum of 60 to 70 centibars. (This is generally sufficient to pull moisture from the surrounding soil material.) Watch the vacuum gauge closely so that the valve can be closed at the appropriate vacuum level. A vacuum release valve is attached to the vacuum port to prevent implosion of the lysimeter.
- 6.2.8 When the required vacuum is reached, close both the influent and effluent valves on the lysimeter. Turn off both the vacuum pump and the generator. The vacuum gauge may then be removed from the fitting on the sanitary seal.
- 6.2.9 Record all information on the Field Lysimeter Log (Attachment C), including the evacuation date and the vacuum level.
- 6.2.10 Do not disturb the suction lysimeter for 48 h to allow the moisture to be extracted from the soil pores.
- 6.2.11 After 48 h, attach the vacuum gauge to the male quick-disconnect fitting on the seal. Open the valve, and measure the residual vacuum. Record this value and the sample date on the lysimeter log. Remove the gauge, and open the other valve.
- 6.2.12 If unforeseen circumstances arise and the vacuum on the suction lysimeter must remain past the 48 h, it is acceptable to proceed in sampling. However, if the lysimeter does not yield an appreciable amount of water for analysis or it is dry and past history indicates that this should not be the case, a vacuum must be re-applied and the suction lysimeter must remain undisturbed for an additional 48 h before another sample can be drawn.
- 6.2.13 Attach an air line from the pressure side of the pump to the male quick-disconnect fitting.
- 6.2.14 Turn on the generator and pump, and open the pressure valve on the pump forcing a small amount of air pressure (30 to 40 PSI) into the lysimeter chamber.
- 6.2.15 Any water in the lysimeter is forced to the surface and is collected from the dedicated sample line into the appropriate container (SOP 4.3, "Sample Containers and Preservation"). Any excess water is collected in a beaker or graduated cylinder so that total discharge volume can be determined. Record the residual vacuum, sample volume, excess volume, date and the technician's initials on the lysimeter field data sheet. Record all pertinent information (such as ID, date, volume, analysis, field and equipment conditions) in the Document Control Logbook.
- 6.2.16 Label samples per SOP 4.2, "Sample Control and Documentation" and SOP 4.4, "Guide to the Handling, Packaging, and Shipping of Samples."

6.3 Post Operation

- 6.3.1 Perform post-operation activities described in SOP 4.1, including decontamination of equipment.
- 6.3.2 Conduct a cross-check of sample bottles in possession with those recorded in the logbook before leaving the sampling site and complete the chain-of-custody per SOP 4.2.

Procedure No. ERD SOP-1.9	Revision Number 4	Page 5 of 11
-------------------------------------	-----------------------------	---------------------

- 6.3.3 Arrange for delivery of samples. Specifics on sample shipment can be found in SOP 4.4, "Guide to the Handling, Packaging, and Shipping of Samples." Deliver or ship samples to the appropriate laboratory as soon as possible after collection.
- 6.3.4 Deliver all field logbook notes, field forms, and copies or originals of chain-of-custody forms to the Data Management Team.

7.0 QUALITY ASSURANCE RECORDS

- 7.1 Document Control Logbook
- 7.2 Chain-of-Custody Forms
- 7.3 Field Lysimeter Sampling Log

Equipment Checklist

Procedure No. ERD SOP-1.9	Revision Number 4	Page 7 of 11
------------------------------	----------------------	--------------

EQUIPMENT CHECKLIST

- _____ Generator
- _____ Two-way radio
- _____ Thomas electric air pump/vacuum pump
- _____ Vacuum gauges
- _____ Beaker/graduated cylinder
- _____ Tool kit
- _____ Sample labels
- _____ Sample containers
- _____ Ice chests and ice
- _____ Ziploc-type bags
- _____ Padding for packaging of samples
- _____ Extra fittings and sample lines
- _____ Trash bags
- _____ Document control logbook
- _____ Vinyl gloves
- _____ Disposable towels
- _____ Any additional field supplies per SOP 4.1, "General Instructions for Field Personnel"
- _____ Extension cord
- _____ Snake chaps (Spring–Summer)
- _____ Field Data Sheets
- _____ Appropriate maps
